1. Overview

The Auth Service (auth-service) is owned by the Identity Platform team, with Sofia Marquez as technical lead. It is implemented in Go 1.22 and listens on port 9000. Infrastructure changes go through Terraform plans that need two approvals. On-call handover happens every Monday at 10:00 local time. Container images are built once and promoted across environments by digest.

Postmortems are blameless and are published within five business days. Structured JSON logging is mandatory; free-text logs are dropped by the log pipeline. Remember to tag pull requests with the owning team so reviews get routed correctly. The dashboards were updated to show saturation alongside latency and errors.

2. Data Stores

Primary data store: PostgreSQL identity-db. Feature work is paused during incident follow-up weeks until action items are closed. Infrastructure changes go through Terraform plans that need two approvals.

3. Dependencies

Auth Service depends on: identity-db, Keycloak realm acme-prod. Remember to tag pull requests with the owning team so reviews get routed correctly. Feature work is paused during incident follow-up weeks until action items are closed.

4. Security and Authentication

Authentication mechanism: Auth Service uses issues the tokens other services use; see token signing notes. Flaky integration tests in CI are tracked on the quality board; please do not just re-run them. Every service has a README that links to its dashboards and runbook.

5. Scaling

Service-level objectives are reviewed quarterly with product owners. Load tests should be coordinated in the platform channel so they do not trip alerts. Container images are built once and promoted across environments by digest. All services must expose Prometheus metrics on the /metrics path. Container images are built once and promoted across environments by digest.

Container images are built once and promoted across environments by digest. Structured JSON logging is mandatory; free-text logs are dropped by the log pipeline. 6. Open Questions

On-call handover happens every Monday at 10:00 local time. All services must expose Prometheus metrics on the /metrics path. Database schema migrations must be backward compatible for at least one release.
